Development Cost Statement

Computational pathology triage platform: build, test and evaluation

Statement of the effort, infrastructure and third-party consumption applied to the design, build, verification and evaluation of the computational pathology triage platform, covering the period to 15 October 2026.

£54,850	£1,478	3826	£56,328
Engineering effort	Infrastructure, data and API consumption	Lines of production code	Total cost of development

Basis of preparation

Figures shown as MEASURED are verified directly against the delivered repository and are reproducible: code volume, artefact sizes, evaluation corpus size and verification results.

Figures shown as MODELLED are a planning schedule. Day rates reflect senior UK contract market rates for the disciplines engaged. Effort in days and third-party consumption are estimates and should be replaced with actuals, drawn from timesheets and provider billing, before this statement is issued externally.

This document is a cost statement. It becomes a valid VAT invoice on insertion of the registered company details and VAT number above.

1. Scope delivered

All figures in this section are MEASURED from the repository.

1.1 Production code

Component	Modules	Lines
Model, inference and API layer (Python)	25	2,388
Clinical dashboard (React, JSX and CSS)	16	1,438
Total	**41**	**3,826**

1.2 Trained artefacts and deployment assets

Artefact	Size	Status
model.pth (ResNet50 backbone, 3-class head)	94.36 MB	Delivered, superseded
LungDisease_Classifier.pth (LC25000CNN, 4,750,885 parameters)	19.01 MB	Delivered, in service
lung_classifier.onnx (browser inference graph)	19.01 MB	Delivered, in service
WebAssembly inference runtime	14.24 MB	Vendored and pinned
Funder deck and hosting assessment documents	0.02 MB	Delivered

1.3 Verification and evaluation

Activity	Result	Basis
Numerical parity, PyTorch against ONNX Runtime	3.8e-06 maximum absolute difference	Measured
Labelled evaluation corpus	120 images, 40 per class	Measured
Label-mapping determination	All 6 permutations evaluated, best mapping identified	Measured
End-to-end smoke test	6 of 6 checks passed	Measured
Three-class accuracy, held-out data	Not yet established	Outstanding

The evaluation corpus is drawn from the same public dataset used for training and therefore is not a held-out result. Establishing a held-out split is the first milestone of the funded programme.

2. Engineering effort applied

MODELLED. Day rates reflect senior UK contract market rates. Effort is derived from the delivered scope above and should be reconciled to timesheets.

Role	Day rate	Days	Amount
Principal Machine Learning Engineer (technical co-founder)	£950	24	£22,800
Senior Software Engineer, front end	£750	15	£11,250
Research Scientist, evaluation and validation	£800	9	£7,200
DevOps and Release Engineer	£650	6	£3,900
Technical Author, documentation and regulatory preparation	£500	5	£2,500
Clinical and Regulatory Advisor (fractional)	£1,200	3	£3,600
Commercial Lead (fractional)	£900	4	£3,600
Total engineering effort			**£54,850**

2.1 Effort distribution

Workstream	Description	Days
Discovery and architecture	Problem definition, data strategy, architecture and deployment model selection.	6
Model integration	Checkpoint reconstruction, architecture matching, inference layer, ONNX export.	10
Front end	Clinical dashboard, upload pipeline, results panel and explainability viewer.	12
Explainability	Occlusion sensitivity implementation to replace unavailable Grad-CAM.	5
Evaluation	Labelled corpus assembly, label permutation study, accuracy measurement.	9
Verification	Numerical parity testing, smoke tests, defect resolution.	7
Deployment	Static build, hosting configuration, release pipeline, runtime vendoring.	6
Documentation	Cost statement, funder deck, hosting assessment, technical notes.	6
Governance and commercial	Funder strategy, governance requirements, IP and entity framing.	5

3. Infrastructure, data and API consumption

MODELLED. Usage figures are estimates for the period and should be replaced with provider billing data before external issue.

Item	Quantity	Rate	Amount
Agentic development and code generation API consumption	28.5 M tokens	£2.10 / M	£60
Model training and fine-tuning compute	24 GPU hours	£2.40 / hr	£58
Evaluation and validation compute	60 CPU hours	£0.12 / hr	£7
Dataset acquisition, licensing and transfer	1 lot	£240	£240
Object storage and backup for artefacts	12 months	£14 / month	£168
Application hosting and content delivery	12 months	£20 / month	£240
Development tooling and design library licences	1 lot	£640	£640
Domain, TLS and identity services	1 lot	£65	£65
Total infrastructure and consumption			**£1,478**

Planned allocations not yet drawn, including the supercomputing allocation referred to in the funding strategy, are excluded from this statement and will be reported against the period in which they are consumed.
